URINE TROUBLE!

ADVISER QUICK START / INDEPENDENT WEBSITE HANDOVER

Project team _____ **School** _____

Adviser _____ **Maintainer** _____

1. Keep the project under your control

The agreed group or school should control the source repository and hosting account. Add the adviser as a repository collaborator for future updates. Public visitors need no ChatGPT login. A maintainer uses a GitHub account only to publish or manage the files.

2. Open the published website

kitkitskii.github.io/urine-trouble/
Published — GitHub deployment succeeded. GitHub Pages is configured to use **main / /(root)**. The repository is **github.com/kitkitskii/urine-trouble**. Visitors need no account; the adviser can publish future updates through an agreed GitHub collaborator account.

3. Edit, export, then publish updates

1. Open the website and choose Edit Content.

2. Update questions, answers, pictures, titles, points or learning notes.

3. Apply the changes and test them. Applying starts a fresh score session.

4. Export the updated website ZIP and extract it.

5. Replace the repository's root files and commit the update.

6. Wait for Pages deployment, then test the public copy.

Important: browser drafts are local. Apply changes does not update the public website for other devices. Export and publish the changed files to share them.

4. Retain the independent backup

Keep the website ZIP, standalone HTML, exported project JSON, these guides, and the final owner/maintainer details. Open **Urine_Trouble_Editable.html** in a full computer browser for offline play. Local-file saved progress depends on browser support.

What is included

Eight games, 68 urinary questions, 32 picture clues, 12 matching pairs in three rounds, six ordering puzzles, eight mistake checklists, eight sorting rounds, memory cards, learning notes, flashcards, classroom scores and a teacher editor. The site uses plain HTML, CSS and JavaScript with embedded images; no backend or build command is required.

Publication record

Repository: github.com/kitkitskii/urine-trouble
Public website: kitkitskii.github.io/urine-trouble/

See PUBLISHING.md for the successful deployment record. A public repository exposes the source and question bank. No custom domain has been registered or connected.
